What is Tailwind CSS?	2
-----------------------------	---

What is Tailwind CSS?

Tailwind CSS is a framework that lets you style HTML using pre-made classes, meaning you don't have to write custom CSS. Think of it as a large collection of styling options already set up for you, like colors, padding, and margins, that you can directly use in your HTML.

What is Tailwind CSS?

Tailwind CSS is a "utility-first" CSS framework, where styling is done with small classes applied directly in your HTML. Instead of writing CSS code for each style, you add classes that Tailwind CSS provides to your HTML elements. These classes are all listed on the Tailwind CSS website.

How to Use Tailwind CSS?

There are two main ways to use Tailwind CSS:

1. Using a CDN Link

- You can use Tailwind CSS quickly by adding a script link in your HTML file.
- Get this link from the <https://tailwindcss.com/docs/installation/play-cdn>, under the Play CDN tab. It will look like this:

```
<script src="https://cdn.tailwindcss.com"></script>
```

1. Installing Tailwind CSS Locally

- For a more powerful setup, you can install Tailwind CSS fully. Follow these steps:

Steps to Set Up Tailwind CSS Locally

1. Install Node.js

- Download Node.js from [here](#).
- Open a command prompt and type `node --version` to confirm it's installed.

2. Set Up Your Project in VS Code

- Create an `index.html` file.
- Open the terminal in VS Code (`Ctrl + Shift + ``).

3. Install Tailwind CSS

- Run the following commands one by one in the terminal
`npm install -D tailwindcss postcss autoprefixer vite`
`npx tailwindcss init -p`

4. Install the Tailwind CSS IntelliSense Extension

- This helps VS Code show Tailwind class suggestions as you type.

5. Update Tailwind Configuration

- In the `tailwind.config.js` file, add this to the content section

```
content: ["*"]
```

6. Update package.json for Easier Starting

- In `package.json`, under "scripts", add

```
"scripts": {  
  "start": "vite"  
},
```

7. **Create a CSS File for Tailwind**

- Make a new file called main.css and add these lines:
@tailwind base;
@tailwind components;
@tailwind utilities;

8. **Run the Development Server**

- In the terminal, type:

```
npm run start
```

This will start a local server where you can preview your project. You'll get a link like <http://localhost:5173>.

9. **Test with Tailwind Classes**

- In index.html, add some HTML elements and give them Tailwind classes, like

```
<div class="bg-orange-900 p-4 text-white">Hello Tailwind!</div>
```

Once you complete these steps, you'll be ready to use Tailwind CSS to style your web pages!
